"The complete cDNA coding sequence for the mouse pro alpha 1(1) chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hydroxyapatite.

PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

SIMILARITY: Belongs to the fibrillar collagen family.

SIMILARITY: Contains 1 VWPC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                          Bize

Example 1; SEQ ID NO 3; 31pp; English.

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-3. This is a tetramer of human recombinant gelatin-like protein Hu-3. This is a tetramer of human recombinant gelatin-like protein Hu-1. ADM48390. A claimed composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid comotic function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kDa and an sors 50 kDa and an isoselectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or isoselectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or clearance rate from blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin derivatives. Recombinant gelatin-like proteins that are in essence free of hydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to

After administration, the coupled medicament will not diffuse from the circulating blood into the interstitium. Clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, vasodilation, function of erythrocytes, thrombocytes and leukocytes, immune responses, and blood levels of messenger molecules such as

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-3. This is a trimer of human recombinant gelatin-like protein Hu-1 AbM48390. A claimed composition suitable as a substitute for plasma computies a solution of saline and a protein having a colloid osmotic molecular weight of at least 10 kDa and at most 50 kDa and an isoelectric concludar weight of at least 10 kDa and at most 50 kDa and an isoelectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower clearance rate composition, provides better and predictable regulation of clearance rate and which is less susceptible to proteolytic degradation contains that are in essence free of thydroxyproline do not give rise to proteins that are in essence free of thydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically diffuse from the circulating blood into the interstitium. Clearance by circulating blood into the interstitium. Clearance by classma level of the medicament. Suitable medicamente include those convolved in intervening blood clotting, vasodilation, function of erythrocytes, thrombocytes and leukocytes, immune responses, and blood clearance as hormones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

culture support comprises the step of coating a microcarrier bead with gelatine or gelatine-like protein having a molecular weight of about 40-CC 200 kba, and optionally further comprising the step of immobiliaing the gelatine or gelatine-like protein on the microcarrier. In this process, core than 75% preferably more than 85% and more preferably more than 95% of the gelatine or gelatine-like protein has the same molecular weight. CC of the gelatine or gelatine-like protein is recombinantly produced to obtain a material of uniform molecular weight and to reduce the risk of contamination with prions. A claimed cell support consists of microbeads conformination with prions. A claimed cell support consists of microbeads conformation with prions and containing at least 15% proline residues and less than 5% of hydroxyproline residues, with a molecular weight distribution showing a maximum between 40 and 200 kba, at least weight distribution showing a maximum between 40 and 200 kba, at least maximum. Large-scale production of expressed products can be accomplished with gelatine-coated microcarriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQAGVMGFPGPKGAA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of human recombinant gelatin -like polypeptide Hu-3, which has a molecular weight of approximately 54 and which contains multiple Gly-Xaa-Yaa triplets. In an example from the invention, recombinant Hu-3 was immobilised on polystyrene beads using a heterobifunctional crosslinking agent, and used in a spinner flask cell culture. A claimed process for the preparation of a cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is porcine alphal(I) collagen. The present invention crelates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is an important component of arterial sealants, bone correctly drug delivery system, dermal implants, haemostats, and commence inplants, and for treating autoimmune disorders such as chemmatoid arthritis. Collagen is useful in food products such as sausage consturisers. Recombinant gelatin is useful in vaccine formulations for treating viral infections, autoimmune diseases and cancer. Gelatin is medical devices and products, in food and beverage industries, in hair care and skin care products, as a que or adhesive in various care and skin care products, as a light-sensitive coating in various care and shortosesses, as a light-sensitive coating in various celectronic devices, as a photoresist base in photolithographic processes, in printing and photographic applications, in laboratory application, and electrophoretic care analysis, including enzymographic gels

The products of the printing and photographic applications, in laboratory application, and analysis, including enzymographic gels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-cid, hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the cendal and production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              19;

                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                       The present sequence represents a human type 1 (alphal) collagen protein. of 3,4-dehydro-L-prolline into the peptide, using the method of the invention. The specification describes a method for the incorporation of at least one 3,4-dehydro-Loronine residue in the polypeptide with an expoxidation reagent from a polypeptide. The method comprises reacting epoxidation reagent from a polypeptide ontaining at least one 3,4-natural amino acid on structure and function of polypeptides. The method is used for studying the effects of non-atural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bioadhesives), and for incorporating a wide the manner of groups, including therapeutic ligands and biological probes,

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggragating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the nucleic acid sequence into the cell; and contacting the proup consisting of trans-4-hydroxyproline and 3-capacity selected from the group consisting of trans-4-hydroxyproline and 3-capacity selected from the group consisting of trans-4-hydroxyproline and 3-capacity assimilated method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibringen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proteins which do not normally contain trans-4-hydroxyproline. The presents sequence represents a chimaric collagen 1 (alphal)/decorin protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   105
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     150
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      213

The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprise optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell;

incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of proteins depends on the post translational hydroxylation of proline. The present sequence represents chimeric collagen 1 (alphal)/transforming growth factor-betal (TGF-betal) protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               213

New recombinant nucleic acid for expressing collagen or derivatives plants - useful as, e.g. bio-materials and in therapeutic, cosmetic odontological compositions. ä Garrone R, WPI; 1998-362771/31 N-PSDB; AAV60814.

Merot

Disclosure; Fig 7; 138pp; French.

The invention relates to the production of mammalian collagen in plants. 2 clones: alpha3 and alpha22, spanning the human collagen type I gene were isolated from a MG-63 osteosarcoma library. Clone alpha3 contained 83 bp of the 5' untranslated region and the first 1920 bp of coding sequence, whereas clone alpha22 contained sequence encoding amino acids

σ

```
The 147 of the protein and around 500 bp of fragments which were used to construct composite sequences encoding variant collagen molecules. The fragments are: (A) containing nucleotides (ht) - 4 to 479; (B) containing fragments are: (A) containing nucleotides (ht) - 4 to 479; (B) containing or TAA upstream of the sequence encoding the PRS (pathogenesis-related protein S) signal peptide and bases 66-77 from the sequence encoding the N-terminus of the mainor-telopeptide domain (ht 74-534) and the N-terminus of the helicoidal region (ht 535-1920); (B) the Draill Bamil fragment (1709-2808) of alpha22, encoding as 567-936 of the central helicoidal domain (f) the Bamil-ECRE (2803-4362) and al 193-1494 in the C-propeptide domain; (G) the C-terminus of the C-propeptide domain (G) the C-terminus of the C-propeptide domain; (G) the C-terminus of the C-propeptide domain (G) the central helicoidal domain at 193-1494 in the C-propeptide domain; (B) the Bamil-ECRE (2803-4362) and al 193-1494 in the C-propeptide domain; (G) the C-terminus of the C-propeptide domain (G) the central helicoidal domain (C) the C-terminus of the C-propeptide domain; (G) the C-terminus of Diagnesia of the C-terminus of Diagnesia of the C-propeptide domain; (G) the C-terminus of Diagnesia of Compositions; sponges or bandages) and in pharmaceutical; medical, odontological, compositions of one of protein of produce directors, anticancer agents or anti-inflammatories; surgical thread and components of ointments). They are suitable for treating any disorder related to collagen dysfunction and gelatin, produced from collagen; is

claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence ct that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity in an animal of one or more of the polypeptides or their antibodies. The polymerising the one or more compound that a specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more compound that expeditions or their antibodies. The polymucleotide or the compound that compound the sequence presented is a human protein (e.g. gene compound that compound segmental nerve injury (Chung), chronic constriction injury (Cit) and spared nerve injury (Chung), chronic constriction che specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from wipp at the printed specification in the sequence of the printed specification in the specification of the printed specification in the sequence of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (chung), chronic constriction injury (CCI) and spared nerve injury (CMUNG), chronic constriction the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_sequences. New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rat derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an operform the method, in a array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence subjected to pain a method for identifying a compound subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      à
        compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed form it is injury in the specification, but was obtained in electronic form directly from WIPO at

solated or purified lymphocytes derived from blood in abdominal aortic
                                                                                                                                                                                                                                                                                                                                                                The present provides a T-lymphocyte derived from blood in abdominal aortic aneurysm (AAA) patients which are reactive with collagen I, collagen III and their fragments. The invention is useful in diagnosis, prevention and treatment of abdominal aortic aneurysm or rupture in a mammal. The invention is also useful in the vaccine preparation. The present sequence is human collagen I alphal (I) chain protein.
                                                                                                                                                                                                                                                                                     aneurysm patients useful for early diagnosis of aneurysms are reactive with collagen I, collagen III and/or their fragments.

                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                            셤
```

The present invention relates to a method (MI) for diagnosing breast cancer in a patient. The method comprises comparing the level of expression of one or more genes or gene products in a biological sample from the patient with that in a normal patient sample, where a difference

```
in the gene expression in the first sample compared to that in the second sample is a diagnostic of the disease. Also claimed are: method (M2) for claiming ishing between normal and disease tissues; method (M3) for monitoring the response of a breast cancer patient to treatment with an breast cancer agent; method (M4) for identifying a compound for treating the normal and disease tissues cancer agent; and an array for distinguishing between normal and disease tismus cancer agents; and an array for distinguishing to genes selected from ADR99955-ADR99121 or comprising two or more polypeptides selected from ADR99121 and the gene products are polypeptides selected from ADR99122 and the gene products are polypeptides selected from ADR99122.

Chargest and its useful for dismosing breast cancer. M2 and the array are compered for distinguishing between normal and disease tissue. M3 is useful conformation for an anti-cancer agent. M4 is useful for identifying a compound for creating breast cancer. Note: The sequence date for this patent did not compared from part of the printed specification, but was obtained in electronic contour directly from WIPO at ftp.wipo.int/pub/published_pot_second

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1, Al
